

Area-weighted mean (walkability, air quality)
ZIP value = $\sum(\text{value} \times \text{overlap area}) / \sum(\text{overlap area})$
e.g. pieces covering 60% / 30% / 10% of a ZIP with scores 15 / 10 / 5 → 0.6·15 + 0.3·10 + 0.1·5 = 12.5

— solid: joined to ZIP table

---- dashed: planned

..... dotted: ZIP study frame (n = 190) used by every join

Master ZIP table
190 ZIPs × 448 variables
